

SIDE PROJECT · GOOGLE APPS SCRIPT + GEMINI

I handed my Gmail inbox triage over to an AI.

Without ever trusting it blindly.

→ [Here is how](#)

The real cost of an inbox

Every email demands a micro-decision: reply now? dig deeper? ignore?

Multiplied dozens of times a day, that mental load steals focus from deep work.

The important signal drowns in the noise.

A hybrid engine, not an AI gimmick

1 Deterministic rules first

VIPs, sensitive senders, newsletters: classified locally — zero AI calls, zero data sent.

2 Gemini for ambiguous cases

Scores action / effort / urgency with a strictly schema-constrained JSON response.

3 Labels applied in Gmail

Triage shows up right in the inbox — no new tool to adopt.

Three labels, one decision already made

Needs attention

A decision, an urgent issue or deep work to handle.

Quick action

A reply or check done in ~2 minutes.

No action

Informative: skim it, then archive.

+ a daily 8 AM digest sums up everything still pending.

Security first

Prompt-injection proof

Emails are treated as untrusted data: an instruction hidden inside a message is never executed.

A “never send to AI” list

Sensitive senders are classified locally — their content never leaves the account.

Protected API key

Never exposed to the browser, redacted from error logs.

Least privilege

OAuth scopes trimmed to the strict minimum.

Under the hood

Locks & quotas

Concurrent runs kept in check, Google quotas protected.

Quarantine

A repeatedly failing thread is isolated instead of looping.

Smart retries

Exponential backoff, jitter, and Retry-After compliance.

34 unit tests

Runnable locally (Node.js) and inside Apps Script.

100% Google Apps Script.

No server to maintain. No data ever leaves your Google account.

Web configuration dashboard, bilingual FR/EN, daily digest, open source.

How many micro-decisions does your inbox steal from you every day?
